How to set your server to synchronize with phpBB

Requirements
Java 1.6 – this WILL NOT work with 1.5

Serverconfig.txt settings
Server must be configured to use MySQL. Besides those, the phpBB settings must be set properly:

MYSQL_SYNCHPHPBB=true
PHPBB_USER – a user with full privileges to the phpBB database
PHPBB_PASS – PHPBB_USER's password
PHPBB_HOST – the host that the phpBB MySQL server is running on.
PHPBB_DB – the database name
PHPBB_TABLE_PREFIX – all phpBB tables share a common prefix, phpbb_ by default.
                            This prefix is set during the installation
PHPBB_MAJOR_VERSION – Major version of your phpBB installation
PHPBB_URL – the url to be passed to the user on registration, pointing to your forum.
SMTPHOST – your mailhost
MAILPASSREQUIRED – whether or not SMTP AUTH is required by your mail server
MAILUSER – only if MAILPASSREQUIRED=true
MAILPASS – only if MAILPASSREQUIRED=true

phpBB requirements
Currently, only version 2.0.22 is supported. As SOs request, I'll update. There is absolutely no way I'm going to be able to add support for every single version that comes out.
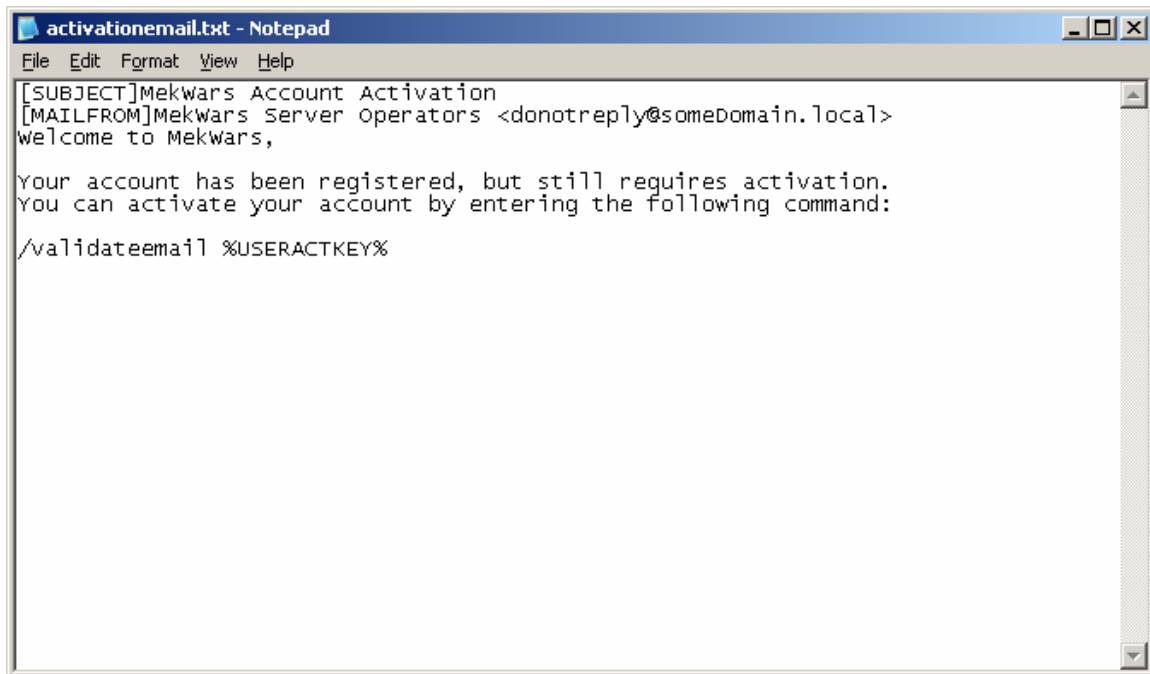

File requirements
./lib must contain both mailapi.jar and smtp.jar or the server will not start
./data must contain activationemail.txt or the server will be unable to send the activation emails to new users

Customizing your activation email

By default, the email is very bare bones. Activationemail.txt looks like this:

```
activationemail.txt - Notepad
File  Edit  Format  View  Help

[SUBJECT]MekWars Account Activation
[MAILFROM]MekWars Server Operators <donotreply@someDomain.local>
Welcome to MekWars,

Your account has been registered, but still requires activation.
You can activate your account by entering the following command:

/validateemail %USERACTKEY%
```

You can customize any part of this, with the following rules:

The [SUBJECT] line will be placed in the subject field of the email
The [MAILFROM] line will be used as the From: field. This should be in the format
displayName <emailAddress>
The remainder of the file contains the welcome message you want. Make sure to include
the activation key, which will be substituted for the %USERACTKEY% token

TEST TEST TEST
I cannot stress this enough. If you are going to synch this up, make *sure* your
activation emails are being sent. If you don't, and users don't get their emails, they will
be unable to activate their accounts, and therefore will be unable to log in to the forum,
and unable to defect from the Newbie Faction.
